

Applicants : Knut S. Grimsrud, et al.  
Serial No. : 09/471,100  
Filed : December 21, 1999  
Page : 2

Attorney Docket No.: 10559-111001  
Intel Docket No.: P7645

IN THE CLAIMS:

Please amend the claims as follows:

- Sub D1
1. (Previously Amended) A method of reading data from a storage medium, comprising:
- reading data on the storage medium in response to a command, the data comprising prefetch data and demand data;
- storing the demand data in a region of memory; and
- issuing an interrupt after the demand data has been stored in memory and while the prefetch data is being read.
- C1
2. (Original) The method of claim 1, further comprising consulting a database to determine when to issue the interrupt.
3. (Original) The method of claim 2, wherein the database comprises instructions for storing the data and for issuing the interrupt.
4. (Original) The method of claim 2, wherein the database comprises a scatter/gather list.
5. (Previously Amended) The method of claim 1, wherein the demand data is read from a first location on the storage medium and the prefetch data is read from a second

location on the storage medium, the first location preceding the second location in a direction of movement of the storage medium during reading.

Sub D1  
6. (Previously Amended) The method of claim 5, further comprising reading additional prefetch data from a third location on the storage medium, the third location preceding the first and second locations in a direction of movement of the storage medium during reading.

7. (Currently Amended) A method by which a host processing device reads data from a storage medium of a disk drive, comprising:

reading data from a first location on the storage medium in response to a command requesting data at a second location on the storage medium; and

reading data from the second location on the storage medium in response to the command, the first location preceding the second location in a direction of movement of the storage medium during reading;

wherein reading data from the first location and reading data from the second location are performed as part of a single access of the storage medium in response to the command.

8. (Original) The method of claim 7, wherein the first location is adjacent to the second location.

Applicants : Knut S. Grimsrud, et al.

Filed : December 21, 1999  
Page : 4

Attorney Docket No.: 10559-111001  
Intel Docket No.: P7645

9. (Previously Amended) The method of claim 7, further comprising reading data from a third location on the storage medium, the third location following the second location in the direction of movement of the storage medium during reading.

Sub D1  
10. (Original) The method of claim 9, wherein the third location is adjacent to the second location.

11. (Original) The method of claim 7, further comprising receiving the command from a computer program executing on the host processing device.

12. (Original) The method of claim 7, further comprising storing data read from the first and second locations in a memory on the host processing device.

13. (Previously Amended) A machine-readable medium that stores instructions to read data from a storage medium, the instructions causing a machine to:

read data on the storage medium in response to a command, the data comprising prefetch data and demand data;

store the demand data in a region of memory; and

issue an interrupt after the demand data has been stored in memory and while the prefetch data is being read.

Intel Docket N. : P7645

14. (Previously Amended) The machine-readable medium of claim 13, further comprising instructions that cause the machine to consult a database to determine when to issue the interrupt.

15. (Previously Amended) The machine-readable medium of claim 14, wherein the database comprises instructions for storing the data and for issuing the interrupt.

16. (Previously Amended) The machine-readable medium of claim 14, wherein the database comprises a scatter/gather list.

17. (Previously Amended) The machine-readable medium of claim 13, wherein the demand data is read from a first location on the storage medium and the prefetch data is read from a second location on the storage medium, the first location preceding the second location in a direction of movement of the storage medium during reading.

18. (Previously Amended) The machine-readable medium of claim 17, further comprising instructions that cause the machine to read additional prefetch data from a third location on the storage medium, the third location preceding the first and second locations in a direction of movement of the storage medium during reading.

19. (Currently Amended) A computer program stored on a computer-readable medium which causes a host processing device to read data from a storage medium of a

Intel Docket No.: P7645

disk drive, the computer program comprising instructions that cause the host processing device to:

read data from a first location on the storage medium in response to a command requesting data at a second location on the storage medium; and

read data from the second location on the storage medium in response to the command, the first location preceding the second location in a direction of movement of the storage medium during reading;

wherein reading data from the first location and reading data from the second location are performed as part of a single access of the storage medium in response to the command.

20. (Original) The computer program of claim 19, wherein the first location is adjacent to the second location.

21. (Previously Amended) The computer program of claim 19, further comprising instructions that cause the host processing device to read data from a third location on the storage medium, the third location following the second location in the direction of movement of the storage medium during reading.

22. (Original) The computer program of claim 21, wherein the third location is adjacent to the second location.

Attorney Docket No.: 10559-111001  
Intel Docket No.: P7645

23. (Original) The computer program of claim 19, further comprising instructions that cause the host processing device to receive the command from a computer program executing on the host processing device.

Sub D1  
24. (Original) The computer program of claim 19, further comprising instructions that cause the host processing device to store data read from the first and second locations in a memory on the host processing device.

cl  
25. (Previously Amended) An apparatus for reading data from a storage medium, comprising:

a memory which stores computer instructions; and

a processor which executes the computer instructions to (i) read data on the storage medium in response to a command, the data comprising prefetch data and demand data, (ii) store the demand data in a region of memory, and (iii) issue an interrupt after the demand data has been stored in memory and while the prefetch data is being read.

26. (Original) The apparatus of claim 25, wherein the processor executes computer instructions to consult a database to determine when to issue the interrupt.

27. (Original) The apparatus of claim 26, wherein the database comprises instructions for storing the data and for issuing the interrupt.

Applicants: Knut S. Grimsrud, et al.

Intel Docket No.: P7645

Sub P1  
28. (Previously Amended) The apparatus of claim 25, wherein the demand data is read from a first location on the storage medium and the prefetch data is read from a second location on the storage medium, the first location preceding the second location in a direction of movement of the storage medium during reading.

C1  
29. (Currently Amended) An apparatus for reading data from a storage medium of a disk drive, comprising:

a memory which stores computer instructions; and

a processor which executes the computer instructions to (i) read data from a first location on the storage medium in response to a command requesting data at a second location on the storage medium, and (ii) read data from the second location on the storage medium in response to the command, the first location preceding the second location in a direction of movement of the storage medium during reading;

wherein reading data from the first location and reading data from the second location are performed as part of a single access of the storage medium in response to the command.

30. (Original) The apparatus of claim 29, wherein the first location is adjacent to the second location.

31. (Previously Added) A method of reading data from a storage medium, comprising:

Applicants : Knut S. Grimsrud, et al.  
Serial No. : 09/471,100  
Filed : December 21, 1999  
Page : 9

Intel Docket No.: P7645

reading data on the storage medium in response to a command;  
storing the data in a region of memory; and  
consulting a database to determine when to issue an interrupt;  
wherein the interrupt is issued after a predetermined portion of the data has been  
stored in memory.

32. (Previously Added) The method of claim 31, wherein the database comprises  
instructions for storing the data and for issuing the interrupt.

33. (Previously Added) The method of claim 31, wherein the database comprises  
a scatter/gather list.

34. (Previously Added) The method of claim 31, wherein the predetermined  
portion of data is read from a first location on the storage medium and additional data is  
read from a second location on the storage medium, the first location preceding the second  
location in a direction of movement of the storage medium during reading.

35. (Previously Added) The method of claim 34, further comprising reading data  
from a third location on the storage medium, the third location preceding the first and  
second locations in a direction of movement of the storage medium during reading.

Sub D1  
C1

36. (Previously Added) A machine-readable medium that stores instructions to read data from a storage medium, the instructions causing a machine to:

- read data on the storage medium in response to a command;
- store the data in a region of memory; and
- consult a database to determine when to issue an interrupt;

wherein the interrupt is issued after a predetermined portion of the data has been stored in memory.

37. (Previously Added) The computer program of claim 36, wherein the database comprises instructions for storing the data and for issuing the interrupt.

38. (Previously Added) The computer program of claim 36, wherein the database comprises a scatter/gather list.

39. (Previously Added) The computer program of claim 36, wherein the predetermined portion of the data is read from a first location on the storage medium and additional data is read from a second location on the storage medium, the first location preceding the second location in a direction of movement of the storage medium during reading.

40. (Previously Added) The computer program of claim 39, further comprising instructions that cause the machine to read data from a third location on the storage

medium, the third location preceding the first and second locations in a direction of movement of the storage medium during reading.

41. (Previously Added) An apparatus for reading data from a storage medium, comprising:

a memory which stores computer instructions; and

a processor which executes the computer instructions to (i) read data on the storage medium in response to a command, (ii) store the data in a region of memory, and (iii) consult a database to determine when to issue the interrupt;

wherein the interrupt is issued after a predetermined portion of the data has been stored in memory.

42. (Previously Added) The apparatus of claim 41, wherein the database comprises instructions for storing the data and for issuing the interrupt.

43. (Previously Added) The apparatus of claim 41, wherein the database comprises a scatter/gather list.

44. (Previously Added) The apparatus of claim 41, wherein the predetermined portion of data is read from a first location on the storage medium and additional data is read from a second location on the storage medium, the first location preceding the second location in a direction of movement of the storage medium during reading.

Applicants: Knut S. Grimsrud, et al.

Intel Docket No.: P7645

45. (Previously Added) The apparatus of claim 44, wherein the processor executes instructions to read data from a third location on the storage medium, the third location preceding the first and second locations in a direction of movement of the storage medium during reading.

46. (Previously Added) A method of reading data from a storage medium, comprising:  
reading data on the storage medium in response to a command, the data comprising prefetch data and demand data;  
storing the demand data in a region of memory; and  
issuing an interrupt after the demand data has been stored in memory;  
wherein the demand data is read from a first location on the storage medium and the prefetch data is read from a second location on the storage medium, the first location preceding the second location in a direction of movement of the storage medium during reading.

47. (Previously Added) The method of claim 46, further comprising consulting a database to determine when to issue the interrupt.

48. (Previously Added) The method of claim 47, wherein the database comprises instructions for storing the data and for issuing the interrupt.

Applicants: Knut S. Grimsrud, et al.  
Serial No. : 09/471,100  
Filed : December 21, 1999  
Page : 13

Attorney Docket No.: 10559-111001  
Intel Docket No.: P7645

49. (Previously Added) The method of claim 47, wherein the database comprises a scatter/gather list.

50. (Previously Added) The method of claim 46, further comprising reading additional prefetch data from a third location on the storage medium, the third location preceding the first and second locations in a direction of movement of the storage medium during reading.

51. (Previously Added) A machine-readable medium that stores instructions to read data from a storage medium; the instructions causing a machine to:

read data on the storage medium in response to a command, the data comprising prefetch data and demand data;

store the demand data in a region of memory; and

issue an interrupt after the demand data has been stored in memory;

wherein the demand data is read from a first location on the storage medium and the prefetch data is read from a second location on the storage medium, the first location preceding the second location in a direction of movement of the storage medium during reading.

52. (Previously Added) The machine-readable medium of claim 51, further comprising instructions that cause the machine to consult a database to determine when to issue the interrupt.

Sub D1  
C1  
53. (Previously Added) The machine-readable medium of claim 52, wherein the database comprises instructions for storing the data and for issuing the interrupt.

54. (Previously Added) The machine-readable medium of claim 52, wherein the database comprises a scatter/gather list.

55. (Previously Added) The machine-readable medium of claim 52, further comprising instructions that cause the machine to read additional prefetch data from a third location on the storage medium, the third location preceding the first and second locations in a direction of movement of the storage medium during reading.

56. (Previously Added) An apparatus for reading data from a storage medium, comprising:

a memory which stores computer instructions; and

a processor which executes the computer instructions to (i) read data on the storage medium in response to a command, the data comprising prefetch data and demand data, (ii) store the demand data in a region of memory, and (iii) issue an interrupt after the demand data has been stored in memory;

wherein the demand data is read from a first location on the storage medium and the prefetch data is read from a second location on the storage medium, the first location preceding the second location in a direction of movement of the storage medium during reading.

Sub D1  
57. (Previously Added) The apparatus of claim 56, wherein the processor executes instructions to consult a database to determine when to issue the interrupt.

C1  
58. (Previously Added) The apparatus of claim 57, wherein the database comprises instructions for storing the data and for issuing the interrupt.

59. (Previously Added) The apparatus of claim 57, wherein the database comprises a scatter/gather list.

60. (Previously Added) The apparatus of claim 56, further comprising reading additional prefetch data from a third location on the storage medium, the third location preceding the first and second locations in a direction of movement of the storage medium during reading.

61. (Currently Amended) A method of reading data from a storage medium, comprising:

Applicants: Knut S. Grimsrud, et al.  
Serial No. : 09/471,100  
Filed : December 21, 1999  
Page : 16

Attorney Docket No.: 10559-111001  
Intel Docket No.: P7645

reading data on the storage medium in response to a command, the data comprising prefetch data and demand data, the prefetch data being read from an area of the storage medium that precedes the demand data in a direction of movement of the storage medium during reading and from an area of the storage medium the follows the demand data in a direction of movement of the storage medium during reading;

storing the demand data in a region of memory; and

issuing an interrupt after the demand data has been read ~~stored in memory~~.

62. (Previously Added) The method of claim 61, further comprising consulting a database to determine when to issue the interrupt.

63. (Previously Added) The method of claim 62, wherein the database comprises instructions for storing the data and for issuing the interrupt.

64. (Previously Added) The method of claim 62, wherein the database comprises a scatter/gather list.

65. (Currently Amended) A machine-readable medium that stores instructions to read data from a storage medium, the instructions causing a machine to:

read data on the storage medium in response to a command, the data comprising prefetch data and demand data, the prefetch data being read from an area of the storage medium that precedes the demand data in a direction of movement of the storage medium
